

# CSE4509 Operating Systems

## Introduction

Salman Shamil

United International University (UIU)  
Summer 2025

Original slides by Mathias Payer and Sanidhya Kashyap [EPFL]

- What you will learn in this course (and how)
- What an OS is and why you want one
- Why you should know about OSes

- **Slides** and **Lectures** on OS Design
- Textbook: **Operating Systems: Three Easy Pieces**
- Other Books:
  - Operating System Concepts, Silberschatz, Galvin & Gagne, 10th ed. (Wiley, 2019)
  - Modern Operating Systems, Tanenbaum & Bos, 4th ed. (Pearson, 2015)
- Coding Examples & Practice Problems

- **Assessment Methods**

Assessment Item	Weight (%)
Attendance	5
Assignment	5
Class Test	20
Mid Term	30
Final Exam	40

- **Assessment Methods**

Assessment Item	Weight (%)
Attendance	5
Assignment	5
Class Test	20
Mid Term	30
Final Exam	40

- **Counseling Hours**

Day	Time
Saturday & Tuesday	10:00 AM – 11:00 AM
Sunday & Wednesday	11:00 AM – 01:30 PM

- **Contact:**  Office: **719(A)**  Email: [salman@cse.uiu.ac.bd](mailto:salman@cse.uiu.ac.bd)

# What is an Operating System?

# What is an Operating System?

User

Hardware

# What is an Operating System?

# What is an Operating System?

# What is an Operating System?

OS is middleware between applications and hardware.

- Provides standardized interface to resources
- Manages hardware
- Orchestrates currently executing processes
- Responds to resource access requests
- Handles access control

# OS role #1: Standardized Interface

- Provides **common functionality** to access resources.
- Abstracts hardware, provides a **unified interface**.
  - Example: Network chips A and B are accessed using the same network API that allows sending and receiving packets.
- **Virtualization / Abstraction** of physical resources.

# OS role #1: Standardized Interface

- Provides **common functionality** to access resources.
- Abstracts hardware, provides a **unified interface**.
  - Example: Network chips A and B are accessed using the same network API that allows sending and receiving packets.
- **Virtualization / Abstraction** of physical resources.
- **Challenges:**
  - Defining the correct abstractions (e.g., what level)
  - What hardware aspects should be exposed and how much

## OS role #2: Resource Management

The OS shares (limited) resources between applications.

## OS role #2: Resource Management

The OS shares (limited) resources between applications.

- Isolation: protect applications from each other
- Scheduling: provide efficient and fair access to resources
- Limit: share access to resources

# OS Role Analogy

The OS is like a waiter that serves individual clients. The waiter knows the menu, records orders, and delivers food to the right table while keeping track of the bill.

Figure 1: OS as a waiter for processes

# What management services does an OS provide?

- **CPU:** initializes program counter/registers, shares CPU
- **Program memory:** initializes process address space, loads program (code, data, heap, stack)
- **Devices:** read/write from/to disk; device driver is hardware specific, abstracts to common interface

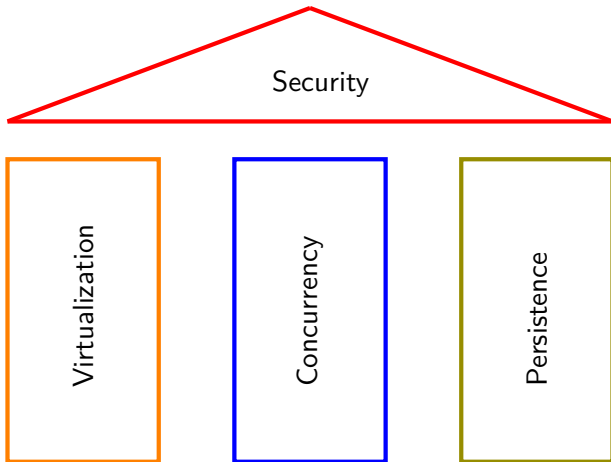

# (Short) History of Operating Systems

- Started as a convenience library of common functions
- Evolved from procedure calls to system calls
- OS code executes at higher privilege level
- Moved from single process to concurrently executing processes

# OS Building Blocks

OS design nicely separates into three pillars, with security as a transcendental layer covering/overarching all pillars.

Each application believes it has all resources for itself

- **CPU:** unlimited amount of instructions, continuous execution
- **Memory:** unlimited memory is available
- **Challenge:** how to share constrained resources

OS must handle ***concurrent events*** and untangle them as necessary.

- Hide concurrency from ***independent*** processes
- Manage concurrency from ***dependent*** processes by providing synchronization and communication primitives
- ***Challenge:*** providing the right primitives

Lifetime of information is greater than lifetime of a process.

- Enable processes to access ***non-volatile information***
- Abstract how data is stored (through a file system)
- Be ***resilient to failures*** (e.g., power loss)
- Provide ***access control***
- ***Challenge:*** authentication and permissions

OS is a gatekeeper, it ensures and enforces security. OS is also privileged and therefore frequently attacked.

- **Isolate** processes from each other and the OS
- **Authenticate** users (who is allowed to do what)
- Protect itself against malicious network/user input
- Harden program execution (through mitigations)
- **Challenge:** performance versus security

# Why you should study OS!

- Build, modify, or administer an operating system.
- Understand design decisions
- Understand system performance
- Enables understanding of complex systems
- Turns you into a better (systems) programmer
